

Boston Children's Hospital Transition Toolkit

Welcome to the Boston Children's Hospital Transition Toolkit!

As a teenager getting ready for adulthood, or as a young adult, you can begin to take control of how you handle your metabolic condition and your health in general. This Toolkit is designed to help you! To start, read through these materials and fill out the forms. You can also begin to look for an adult-focused doctor to replace your pediatrician who only deals with childhood problems. This process of switching to an adult-focused doctor is called *medical care transition* and takes time and planning — but once it's done, it will be great for your future health and success.

Use the following forms to help achieve your medical care transition

Health Readiness
Assessment

Metabolic Condition Basics

Medical Health Summary

Transition Plan

What am I supposed to do with these forms?

Measure your health independence by taking the Health Readiness Assessment and over time try to answer yes to every question.

Read up on your Metabolic Condition Basics and discuss possible adult-health problems with your doctors or nurses.

Ask a doctor or social worker for help filling out the Medical Health Summary and Transition Plan at your next appointment.

Save these forms on your computer and USB flash drive and bring the Transition Toolkit to every medical appointment.

Keep the flash drive in your wallet or purse and save any changes or updates.

Save these forms and bring them to future medical appointments

How will The **Transition Toolkit** help me? With the Toolkit you can –

Decide when you're ready to act as your own health spokesperson.

Prepare for doctor's appointments and fill out health forms.

Talk to doctors and nurses about your medical condition and what roles they should play in your medical care.

Keep track of all of your important medical and condition information.

To get started, fill out the Health Readiness form.

Ask a doctor to help you fill out your forms

This project is supported by the New England Genetics Collaborative and their cooperative agreement with the US Health Resources and Services Administration (HRSA), grant # U22MC10980. © 2013 Boston Children's Hospital. newenglandconsortium.org

Health Readiness Assessment

Are You Ready to Handle Your Own Health Care as an Independent Adult?

To know if you are ready for a health care transition, answer the following questions:

1.	I know my height, weight, birth date, and social security number	☐ Yes	□ No
2.	I know the name of my condition	☐ Yes	□ No
3.	I know my genotype or genetic status	☐ Yes	□ No
4.	I can tell you about my condition and explain my health care needs	☐ Yes	□ No
5.	I know what kind of medical insurance I have	☐ Yes	□ No
6.	I know where to find my medical records	☐ Yes	□ No
7.	I know who to ask about getting my own health insurance	☐ Yes	□ No
8.	I know the basic treatment for my condition	☐ Yes	□ No
9.	I know what my diet should include and not include	☐ Yes	□ No
10.	I know how to prepare my own food	☐ Yes	□ No
11.	I know how to shop for my own food	☐ Yes	□ No
12.	I know the names of my supplements and medicines	☐ Yes	□ No
13.	I know how to order or get my medications filled	☐ Yes	□ No
14.	I know the symptoms and medical problems related to my condition	☐ Yes	□ No
15.	I visit my metabolic specialist regularly	☐ Yes	□ No
16.	I have discussed issues about sex with my doctor	☐ Yes	□ No
17.	I know how to get birth control and how to stay protected against sexually transmitted diseases/infections (STDs)	☐ Yes	□ No
18.	I have discussed the use of tobacco, alcohol and drugs with my doctor	☐ Yes	□ No
19.	I know how to schedule a doctor's appointment	☐ Yes	□ No
20.	I keep a schedule of medical appointments on my calendar	☐ Yes	□ No
21.	I can get myself to medical appointments (or can arrange transportation myself)	☐ Yes	□ No
22.	I know who to call in case of an emergency	☐ Yes	□ No
23.	I prepare questions for my health care provider before appointments	☐ Yes	□ No
24.	I have a support network for my condition	☐ Yes	□ No

Health Readiness Assessment

Are You Ready to Handle Your Own Health Care as an Independent Adult?

Now count the number of times you checked YES.

If you checked YES for:

17 to 24 statements - great work!

You are already taking full responsibility for your health care. The transition forms in this Toolkit will help you become a stronger health advocate.

8 to 16 statements - you are on the right path!

You are actively taking on many important responsibilities in your health care. The following Transition Toolkit forms will help you answer YES to many more of these questions.

0 to 7 statements - let's get started!

Transitioning health care to adult providers and becoming a better health advocate for yourself takes time and planning. Now's a perfect time to start! Pick a few of the previous responsibilities from the list and spend the next month doing them. The Toolkit forms will make this much easier.

Now what?

Update and save this assessment every month until you've answered all of the tasks with a YES!

Next, take a look at some basic information about your metabolic condition.

Metabolic Condition Basics: OTC deficiency

Medical information you need to know as an adult with OTC deficiency

Overview of the Condition:

OTC deficiency is a rare metabolic condition in which a chemical called ornithine transcarbamylase (OTC) does not work correctly in your body. This can cause ammonia to build up in your blood over time. When ammonia builds up too much, it can cause serious health problems. You can manage OTC deficiency throughout your life with a special low-protein diet, drug therapy, and ongoing health care.

OTC deficiency is also sometimes called ornithine transcarbamylase deficiency.

In girls and women, OTC deficiency can be mild, moderate or severe. In boys and men, OTC deficiency is usually severe.

Medical Problems for Babies and Children:

- If OTC deficiency goes undetected, babies and children may have: extreme sleepiness, irritability, vomiting, poor appetite, trouble with breathing or body temperature, unusual body movements, seizures, or coma.
 These symptoms can be triggered by eating a lot of protein, or after an illness or surgery, or by steroid medication.
- If untreated, developmental problems for babies and children with OTC deficiency can include: delayed growth, learning delays, liver damage, skin lesions, or brittle hair.
- Newborns in some US states are now tested for OTC deficiency. If the condition is identified early and treatment and diet are followed carefully, health problems can be prevented or lessened.
- Some babies, children and adults have a liver transplant, which prevents the build-up of ammonia.

Medical Problems for Teens and Young Adults:

- Teens and young adults with OTC deficiency may have learning disabilities.
- If you have an illness, fever, surgery, or are pregnant, contact your health-care provider right away.
- Watch for signs of ammonia build-up (hyperammonemia)including: nausea, vomiting, sleepiness, or unusual problems with your mood or thinking. If you have any of these, get medical care right away.
- Some teens and young adults with OTC deficiency have anxiety or depression. Counseling and medication can help. If you have anxiety or depression, it is important to get in touch with your health care provider to get treatment.

How to Minimize Medical Problems and Complications:

- Follow a low-protein diet recommended by your dietician.
- Take medicines recommended by your health care providers, which may include citrulline.
- Avoid steroids in medication or supplements.
- Avoid medicines that contain valproic acid, including Depakote®. Check with your doctor to find out which
 other medicines contain valproic acid.
- Keep your immunizations up-to-date.
- Stay in regular contact with your health care providers and health specialists.
- Keep an Acute Illness Protocol that you can bring with you to the emergency room: http://newenglandconsortium.org/for-professionals/acute-illness-protocols/urea-cycle-disorders/ornithine-transcarbamylase-deficiency-otc/

Metabolic Condition Basics: OTC deficiency

Medical information you need to know as an adult with OTC deficiency

Fertility and Pregnancy:

- OTC deficiency does not affect your ability to have children.
- Genetic counseling can help you and your partner understand the risks to your children. Your doctor can refer you to a genetic counselor who has a special understanding of your health issues.
- Pregnant women with OTC deficiency must follow a careful diet with special guidance from a dietician and health care providers. The woman with OTC also must be followed very carefully by her doctors for several weeks after the baby is born, since that is a time when she can experience sudden build-up of ammonia.

How To Get Support:

- Get education support from teachers and specialists at your school.
- Join a support group with people who have OTC deficiency or similar metabolic conditions. This group of health conditions is called urea cycle disorders.
- A lot of research is being done on arginase deficiency and other urea cycle disorders. Get up-to-date
 information about new treatments and discoveries at the Urea Cycle Foundation website: http://nucdf.org/

What next?

A final step toward completing your medical transition is meeting with your health care providers to discuss and fill out your Transition Plan.

Transition Plan

Make an ongoing health plan with your health care provider

Fill out this plan with your health care provider, to help you transition to being in charge of your own health						
Patient Name:						
Boston Children's Hospital Medical Record #:						
Primary Care Physician	Phone Number					
	Email					
Pediatrician	Phone Number					
	Email					
Metabolic Specialist	Phone Number					
	Email					
Other Health Care Provider	Phone Number					
	Email					
Emergency Contact Name & Relationship	Phone Number					
Medical Findings						
Genotype/Laboratory Findings						
Treatment Status						
Current Mediations/Treatments						
Allergies/Adverse Reactions						
Past Medical Concerns or Hospitalizations						
Living Situation/Employment						
Mental Health Status/Cognitive Status						

Transition Plan

Other Health Risks

Make an ongoing health plan with your health care provider

Contract:
To enhance collaboration, each person should agree on the following responsibilities:
Metabolic Specialist will:
Obtain labs and tests: For example
Prescribe condition-related medications:
Work with PCP to develop an emergency protocol:
Patient will:
Remember to take medications: For example
Order and pick up supplies/supplements:
Show-up to appointments:
Primary Care Physician will:
Monitor patient's general health:
Update metabolic specialist with important patient information:
Contact metabolic specialist with medical concerns: For example
Other:

When you're done filling out this Transition Plan, print it and save it in a safe place.

Congratulations! You are well on your way to being in charge of your own health.
